Dear Tessel Cargo Software Hiring Team,

I am applying for the Backend Engineer role on the Routing & Tracking team. I bring seven years of professional backend experience, primarily building and operating Java services, and the production engineering background to contribute to a platform where dependable event processing and reliable APIs are essential. Tessel's focus on practical engineering, clear communication, and owning the services you build particularly aligns with my experience.

At Tejo Insurance Tech, I develop and maintain seven Java 17 and Spring Boot microservices. I designed and versioned a REST API used by 12 broker partners, and improved its quote endpoint's p99 latency from 1.8 seconds to 450 milliseconds by adding Redis caching and resolving JPA N+1 queries. I also produce and consume Kafka events for claims workflows, where idempotent consumers and an outbox table eliminated duplicate claim records. These projects have given me hands-on experience with event-driven services, API reliability, and performance improvement that I could bring to shipment tracking and event ingestion.

I also bring experience with relational databases, Docker, automated testing, and AWS cloud delivery. My database background includes Oracle-backed Java services and PostgreSQL in my technical toolkit; I have also written integration tests with Testcontainers, raising payments-module coverage from 35% to 70%. I also deploy services to Kubernetes on AWS EKS using Helm and Jenkins pipelines. I participate in an on-call rota and value the reliability work and clear technical communication needed to operate production services well. English is fluent for me.

I would welcome the opportunity to discuss how my backend and event-processing experience could support Tessel's Routing & Tracking platform. Thank you for your consideration.

Sincerely,
Daniel Okafor-Reyes
