Dear Tessel Cargo Software hiring team,

I am applying for the Backend Engineer (Python) role on the Routing & Tracking team. I bring more than seven years of backend development experience building and operating services, primarily with Java and Kotlin, and I am interested in applying that experience in a role focused mainly on Python. Tessel's focus on dependable, scalable tracking services is a strong match for the systems I have worked on.

At Tejo Insurance Tech, I design and maintain Spring Boot services using PostgreSQL, Kafka and Kubernetes. I designed a versioned REST API for broker partners that now supports around 400,000 quote requests per month. I also resolved duplicate claim records caused by at-least-once Kafka delivery by implementing a transactional outbox pattern and idempotency keys; duplicates fell from about 40 per week to zero over the following quarter. These projects have strengthened my focus on API reliability, data correctness and clear technical trade-offs.

I take part in a monthly on-call rota and handled a major Kafka lag incident, documenting the follow-up in a post-incident account. I also have experience with Docker, AWS services including EKS, S3 and SQS, and automated testing with Testcontainers and contract tests. My professional backend work has been in Java and Kotlin; my Python experience is limited to data-fix scripts and small Jenkins helpers, and I have not yet shipped a Python service. I am keen to build on my production experience while developing further in Python.

Thank you for considering my application. I would welcome the opportunity to discuss how my experience in backend services, event-driven systems and production reliability could contribute to Tessel Cargo Software's shipment tracking platform.

Best regards,
Daniel Okafor-Reyes
