Dear Hiring Team,

I am applying for the Backend Engineer (Python) position on Tessel Cargo Software's Routing & Tracking team. The role's focus on reliable event ingestion and tracking-related backend systems closely matches my experience building high-volume backend systems in Python and Go, including services that process data from 300,000 vehicles.

At Nordfels Telematik, I built fleet-telematics backend systems using Python, C++, PostgreSQL/PostGIS and RabbitMQ, ingesting GPS data from 300,000 vehicles. At Streamhaus, I served as technical lead for the playback API, using Python and designed a Go entitlement service that handled 120,000 requests per second at peak. As Director of Engineering, I drove the migration from a Python 2 monolith to around 60 Python and Go services on GKE, improving playback API availability from 99.5% to 99.95%. These experiences have given me a strong foundation in event-driven systems, API reliability and the practical trade-offs involved in scaling services.

I would bring hands-on Python expertise, experience with PostgreSQL, Kafka, Kubernetes, Terraform, Prometheus, Grafana and OpenTelemetry, as well as a record of improving service ownership and engineering practices. At Streamhaus, I introduced architecture reviews and on-call guidelines adopted company-wide; earlier, I built a Python test harness used by QA for eight years. Tessel's emphasis on dependable services, clear documentation and service ownership matches my experience introducing RFCs, architecture reviews, Python service standards and on-call guidelines.

I would welcome the opportunity to discuss how my backend and platform experience could contribute to Tessel's shipment-tracking platform. Thank you for your consideration.

Kind regards,
Rafael Moretti-Klein
