Dear Tessel Cargo Software hiring team,

I am applying for the Backend Engineer (Python) role on the Routing & Tracking team. I am now focused on hands-on individual-contributor backend work, bringing experience building and migrating Python and Go services and improving the reliability of production APIs.

At Streamhaus, I contributed to a migration from a Python 2 monolith toward approximately 60 Python 3 and Go services on GKE, and established a service template using FastAPI or Go, OpenTelemetry, Prometheus, and Terraform. I also led the technical design and delivery of the playback API, improving its availability from 99.5% to 99.95%. Earlier, I designed and wrote most of a Go entitlement service that handled 120,000 requests per second at peak, with p99 latency under 15 ms. These projects have given me experience balancing throughput, reliability, and practical service design.

I would bring a strong foundation in Python and Go, API development, Kubernetes, observability, and production reliability. I also maintained a Python library tested with pytest and tox. Tessel's focus on dependable services, clear technical decisions, and sustainable reliability work resonates with what I value in engineering: clear ownership, concise decision-making, and services teams can support without burning people out.

I would welcome the opportunity to discuss how my backend and platform experience could contribute to Tessel's shipment tracking platform.

With best regards,

Rafael Moretti-Klein
