Dear Hiring Manager,

I am applying for the Senior Data Engineer – Data Platform role at Halden Pay. Over 12 years in mechanical engineering, I have built practical data-processing tools and used test-results data to support reliable decisions. I am now looking to move into data engineering, bringing a strong foundation in Python, SQL and data validation.

At Corvane Automotive Components, I developed Python scripts that read test-rig output, validate every channel against specifications and generate standard report figures. This reduced report preparation from about three days to half a day per test. I also query a SQL Server database to analyse trends across three product generations. This work has taught me the value of repeatable processes, clear data checks and outputs that colleagues can use with confidence—principles that align with Halden Pay's focus on shared, reusable platform frameworks and data quality.

My experience has been in engineering data rather than operating a cloud data platform. I would bring to the Data Platform team hands-on Python and SQL experience, a disciplined approach to validating data, and a track record of improving a recurring workflow. Halden Pay's emphasis on ownership and simplifying work to move quickly also resonates with the way I approach engineering problems: identify the source of an issue, develop a practical improvement and verify its impact.

I would welcome the opportunity to discuss how my experience could contribute to Halden Pay's data platform and its users across analytics, data science and product teams. Thank you for your consideration.

Sincerely,
Tiago Ferrão-Lindqvist
