Dear Tessel Cargo Software Hiring Team,

I am applying for the Backend Engineer position on the Shipment Tracking Platform. My background building Java and Kotlin services, REST APIs, and Kafka-driven workflows aligns closely with the platform's focus on reliable event ingestion and live tracking. I am particularly interested in bringing that production backend experience to a Python-focused team; my Python experience so far is scripting for data fixes and small Jenkins helpers, not production services.

At Tejo Insurance Tech, I designed a versioned OpenAPI 3 quoting API now used by 12 broker partners for approximately 400,000 requests per month. I also improved the quote endpoint's p99 latency from 1.8 seconds to 450 milliseconds through Redis caching and JPA query improvements. For claims, I implemented a transactional outbox and idempotent Kafka consumers, taking duplicate records from approximately 40 per week to zero over the following quarter. These projects have given me hands-on experience with REST, relational data, event streams, performance, and service reliability.

I also bring practical testing, delivery, and operations experience: I use Testcontainers and Spring Cloud Contract, deploy with Docker and Helm to Kubernetes on AWS EKS through Jenkins, and take part in a monthly on-call rota. During a major Kafka lag incident in March 2024, I helped investigate the issue and wrote a report that was praised. I run my team's backend guild meeting every two weeks and have written Kotlin coding guidelines, experiences that have strengthened my interest in clear technical communication and shared engineering practices.

Tessel's work on dependable live shipment tracking and its investment in Kafka-based event processing make this role especially compelling to me. I would welcome the opportunity to discuss how my experience can contribute to the Routing & Tracking team.

Best regards,
Daniel Okafor-Reyes
