Dear Tessel Cargo Software Hiring Team,

I am applying for the Backend Engineer (Python) role. I bring production backend experience building dependable services and event-driven workflows, including a change that reduced duplicate claim records from around 40 per week to zero over the following quarter.

At Tejo Insurance Tech, I design REST APIs and work with PostgreSQL, Kafka and Kubernetes-based services. I also take part in a monthly on-call rota and handled a major Kafka lag incident in March 2024; the incident write-up was praised. Earlier, at Viajar Online, I raised test coverage of a payments module from 35% to 70% using Testcontainers and extracted notifications from a Java monolith into a Spring Boot service.

My professional service development has been in Java and Kotlin. My Python experience so far is scripting for data fixes and small Jenkins helpers, and I am keen to move into a Python-focused role. I would bring transferable backend experience with REST APIs, relational data, event streaming, automated testing, Docker and AWS EKS, while developing further in Python.

Tessel's work on a live tracking platform fed by carrier events, and its move toward Kafka streams, makes this role a particularly relevant next step for my event-driven systems experience. I would welcome the opportunity to discuss how my background could contribute to the Routing & Tracking team.

Best regards,
Daniel Okafor-Reyes
