Dear Hiring Team,

I am applying for the Backend Engineer (Python) role on Tessel Cargo Software's Routing & Tracking team. The work of turning high-volume events into a dependable live tracking picture is closely connected to problems I have tackled in both fleet telematics and large-scale streaming platforms.

At Nordfels Telematik, I built backend services ingesting GPS data from 300k vehicles, using Python, C++, PostgreSQL/PostGIS and RabbitMQ. At Streamhaus, I designed and wrote most of a Go entitlement service that handled 120k requests per second at peak, with p99 latency under 15 ms. I also served as technical lead for the playback API and contributed to a migration from a Python 2 monolith to around 60 Python and Go services, improving API availability from 99.5% to 99.95%.

My experience includes Python and FastAPI, PostgreSQL, Kafka, Kubernetes, Terraform, and Prometheus and OpenTelemetry. I have also built Python test tooling and maintained an open-source Python retry library. I would bring a hands-on backend perspective to your event ingestion and tracking API, along with experience designing for throughput, reliability and observable production services.

Tessel's focus on dependable live shipment tracking and small teams that own the services they run makes this role especially relevant to my background. I would welcome the opportunity to discuss how my experience could contribute to the Routing & Tracking platform.

Best regards,

Rafael Moretti-Klein
