Dear Hiring Manager,

I am applying for the Machine Learning Engineer – Customer Support AI role at Quillstone Payments. I bring more than five years of experience in NLP and document classification, including taking machine-learning work from research and prototypes into production. The role's focus on building and operating AI systems for customer support is a strong match for my experience delivering language and classification models.

In my current role at Slavonica Document AI, I developed a document-classification model that achieved 94% accuracy across 23 classes and fine-tuned BERTić and XLM-R for named entity recognition on Croatian documents. I introduced MLflow experiment tracking and a model registry, and deployed models as FastAPI services in Docker containers on Azure ML and App Service. I also established production monitoring for data drift with weekly reporting.

My earlier work includes classifying customer complaint topics using TF-IDF, logistic regression and fastText, as well as developing churn-prediction models using gradient boosting and LightGBM. This combination of text-focused machine learning, model serving and production monitoring would allow me to contribute to Quillstone's work on answering merchant questions, routing tickets and supporting agents. I am particularly drawn to the opportunity to take AI ideas from prototype to production in a team focused on reducing friction for merchants.

I would welcome the opportunity to discuss how my experience could contribute to Quillstone's Customer Operations AI team. Thank you for your consideration.

Sincerely, PETRA ZLATARIĆ-NOVOSEL
