Dear Corvale Mobility Hiring Team,

I am applying for the Cloud Infrastructure / DevOps Contractor - Fleet Connectivity engagement. At Tallybrook, I lead platform work focused on AWS and EKS infrastructure, an internal developer platform, reliability, and cost. I built golden-path templates and self-service infrastructure workflows that helped all 14 product teams move new services from about two weeks to production in under one day.

I have also led reliability and capacity work where dependable operation mattered. For 20 critical services, I introduced SLOs and burn-rate alerts that reduced pages per week by about 60 percent, alongside an error-budget policy agreed with product leadership. Earlier, at Brightwater Games, I supported backends serving over one million daily players during launches, moved infrastructure into Terraform with Atlantis, replaced Nagios alerting with Prometheus and Alertmanager, and led capacity planning for two major launches. A k6 test simulating 300,000 concurrent players helped identify and fix a connection-pool limit before launch.

Corvale's work to connect on-board train systems with cloud services calls for infrastructure that is observable, reliable, and ready for production. My experience building and operating AWS platforms, improving infrastructure workflows, and bringing reliability practices into product teams aligns closely with that challenge. I would bring a hands-on approach to infrastructure engineering, practical technical leadership, and a focus on making services easier to deploy and run.

I would welcome the opportunity to discuss how my platform and reliability experience could contribute to Corvale's fleet connectivity work.

Best wishes,
Nadia Brennan-Aziz
