Dear Hiring Manager,

I am applying for the Machine Learning Engineer – Customer Support AI role at Quillstone Payments. My experience combines applied predictive modeling with experimentation and analytics, and I am moving towards machine learning engineering.

At Thistlebox, I built a weekly recipe-level demand forecasting model using LightGBM and calendar features. Operations use it to order ingredients; WAPE fell from 23% to 14%, and food waste was down an estimated 9%. I also built an XGBoost churn propensity model to target retention offers, with uplift validated through a holdout. Alongside this work, I design and analyse around 40 A/B tests annually and built the team's sequential testing calculator.

I also write production SQL in BigQuery and maintain dbt models for the analytics layer, while presenting results to leadership monthly. This experience has taught me to connect modeling work to operational and product questions. I am interested in Quillstone's role because its AI team applies models and assistants to merchant support, routing and agent workflows, and the position brings modeling together with product engineering.

I would welcome the opportunity to discuss how my experience in forecasting, customer analytics and applied machine learning could contribute to the team. Thank you for your consideration.

Yours sincerely,
Tobias Mwangi-Hartley
