Dear Verdane Care hiring team,

I am applying for the Full-Stack Engineer (TypeScript / React) role in your Patient Experience squad. My experience combines accessibility work on a React news site with a full-stack final year project using TypeScript, Node.js, Express and PostgreSQL. Your focus on accessible patient-facing features connects directly with the work I have prioritised in both my internship and my own projects.

At Harbourline Media, I delivered accessibility fixes and built a keyboard- and screen-reader-friendly image gallery for article pages, documented in Storybook and tested using Jest and React Testing Library. My interest in accessibility began when a friend who uses a screen reader showed me the barriers she encountered online. For Tidewatch, my final year project, I put that interest into practice by testing with NVDA and VoiceOver and achieving a Lighthouse accessibility score of 100. That testing experience is relevant to your WCAG 2.2 AA focus, without treating an automated score as proof of conformance.

Tidewatch also gave me experience connecting a React and TypeScript frontend to a Node.js/Express API that caches public weather and tide data, with PostgreSQL storing user favourites. The project received 82% (First Class). Separately, I built a freelance yoga studio website with a class timetable and email booking requests using Next.js and Tailwind CSS, deployed on Vercel. My backend experience comes from projects rather than employment; my professional experience is in React and accessibility. I also helped approximately 30 first-year web development students as a teaching assistant, experience relevant to supporting junior colleagues.

I would welcome the opportunity to discuss how my accessibility work and full-stack project experience could contribute to simpler booking and follow-up experiences for your patients. Thank you for considering my application.

Yours sincerely,

Aiyana Brooks-Tan
