Corvale Mobility
Application: Cloud Infrastructure / DevOps Contractor – Fleet Connectivity

Dear Hiring Team,

Corvale's fleet connectivity platform needs infrastructure that can move from design into dependable production operation. My experience developing Terraform networking modules, operating Azure infrastructure and automating application deployments provides a practical foundation for that work. I am applying for the Cloud Infrastructure / DevOps Contractor role with a background spanning cloud engineering, systems administration and freelance IT services.

In my current contract at Havenstad Logistics, I work in a three-person team operating approximately 400 Azure VMs and 12 AKS clusters across three subscriptions. I developed Terraform modules for landing zone networking, covering hub-spoke VNets, Azure Firewall and private endpoints, and replaced manual deployments for 15 internal applications with Azure DevOps YAML pipelines. This experience aligns directly with your infrastructure-as-code, network design and service deployment needs. My hands-on cloud experience is in Azure, one of the major-cloud alternatives accepted for this engagement.

Previously, I administered approximately 250 Windows and Linux servers and led the migration of 60 servers from VMware to Azure IaaS. That combination brings both migration leadership and operational experience to technical discussions about how infrastructure should be built and run. My freelance work also involved supporting nine small businesses and implementing backups, MFA and conditional access, complementing my networking and Active Directory troubleshooting background with practical security work.

Your plan to connect a new train fleet to backend services makes infrastructure design, secure networking and deployment automation central to the project. These are areas where I can contribute concrete experience while working with your backend and infrastructure team. I would welcome a discussion about how my Terraform, Azure and systems administration background could support the platform from its initial design through production operation.

Kind regards,
Samuel Achterberg-Osei
