Oskar

Application: Full-Stack Engineer (TypeScript / React) - Patient Experience

Dear Verdane Care hiring team,

Your Patient Experience role closely matches the work I do at Älvgrind Fintech: building user-facing onboarding features with React and TypeScript, supported by NestJS APIs and PostgreSQL. Frontend development is my strongest area, alongside hands-on backend experience. That combination is directly relevant to building Verdane Care's booking and intake journeys end to end, where straightforward interactions matter to the people using them.

One example is the Swedish BankID identity verification step I built in 2022, supporting both QR-code and same-device flows through a provider SDK. It was A/B tested on 10% of traffic before full rollout, and onboarding conversion increased from 61% to 74%. This experience connects well with your focus on simplifying patient journeys: delivering the interface and its supporting services, then evaluating the effect on completion.

I have also implemented document uploads using S3 presigned URLs, ClamAV scanning in Lambda and scan-status processing through SQS into PostgreSQL. Alongside this, I worked on an incremental Express-to-NestJS migration behind the existing API gateway. These projects provide relevant experience for third-party integrations and document-handling features, without equating fintech identity documents with the specific privacy requirements of health data.

My experience also includes technical leadership of a React Native ferry ticket app with approximately 50,000 downloads, and four months as acting team lead in 2024, including one-to-ones and sprint planning. I would bring that delivery experience, a strong React and TypeScript foundation, and practical NestJS and AWS experience to your small squad. I would welcome the opportunity to discuss how my work on onboarding and document flows could contribute to Verdane Care's patient experience.

Kind regards,
Oskar
