Corvale Mobility

Application: Cloud Infrastructure / DevOps Contractor – Fleet Connectivity

Dear Hiring Manager,

Corvale's new train fleet needs cloud infrastructure that can move from initial design into dependable production operation. I bring 10 years of infrastructure experience, including six running Kubernetes platforms on AWS, alongside technical leadership, Terraform and operational reliability expertise. This background is directly relevant to the cloud platform and backend deployment foundations of your fleet-connectivity engagement.

As technical lead of Tallybrook's five-person platform team, I operate an EKS platform covering eight clusters, approximately 350 services and three regions. I built an internal developer platform combining service templates, Argo CD GitOps and Crossplane-based provisioning for RDS, SQS and S3, reducing the time from new service to production from approximately two weeks to under one day. This work aligns with your need to take infrastructure initiatives into production and help backend developers deploy services that are straightforward to operate.

At Brightwater Games, I managed AWS infrastructure through approximately 40 Terraform modules, using Atlantis for pull-request-based plan/apply workflows. I also implemented Prometheus, Grafana, Alertmanager and Loki, and used k6 load testing to inform launch-day capacity planning for game backends supporting titles with up to 1.2 million daily active players. At Tallybrook, introducing SLOs and error budgets for 20 critical services reduced weekly on-call pages by approximately 60%; I also wrote the incident and post-mortem process. These are concrete foundations for the observability, alerting and reliability your train-to-cloud services will require.

Your scope combines early architecture decisions with end-to-end operational ownership. My experience building self-service infrastructure, leading a platform team and running production services would support that work. I would welcome a discussion about how my AWS, Terraform and reliability engineering experience could contribute to Corvale's fleet-connectivity platform.

Yours sincerely,
Nadia Brennan-Aziz
