Dear Tessel Cargo Software hiring team,

I am applying for the Backend Engineer (Python) position on the Routing & Tracking team. I bring seven years of professional experience building and operating backend services in Java and Spring Boot, seven years of backend experience in Java and Spring Boot, a comparable-language foundation for a role working mainly in Python. I am keen to apply that production experience while developing further in Python; my Python experience to date has been limited to scripts and small Jenkins helpers.

In my current role at Tejo Insurance Tech, I develop and maintain seven services supporting policy quoting and claims intake. I designed a versioned REST API used by 12 broker partners for around 400,000 quote requests per month, and improved its p99 latency from 1.8 seconds to 450 milliseconds by adding Redis caching and resolving JPA N+1 queries in a PostgreSQL-backed service. I have also worked with Kafka event workflows, implementing idempotent consumers and a transactional outbox that reduced duplicate claim records from around 40 per week to zero over the following quarter. These experiences have given me a practical focus on dependable APIs, data correctness and performance.

I also bring hands-on experience with automated testing, CI/CD and operating services: at Viajar Online, I raised payments-module test coverage from 35% to 70% using Testcontainers; at Tejo, I contribute to CI/CD delivery by deploying services with Docker and Helm to Kubernetes on AWS EKS through Jenkins pipelines. I take part in a monthly on-call rotation and handled a significant Kafka lag incident, contributing an incident write-up that was well regarded. I would welcome the opportunity to bring this production experience to Tessel's shipment tracking platform while developing further in Python.

Tessel's focus on end-to-end ownership, clear communication and operational reliability resonates with how I approach backend work. I would be glad to discuss how my experience designing REST/OpenAPI APIs, building Kafka event-driven services, tuning PostgreSQL queries, and operating production services could contribute to the Routing & Tracking team.

Thank you for considering my application.

Best regards,
Daniel Okafor-Reyes
