Dear Hiring Team,

I am applying for the Backend Engineer (Python) role at Tessel Cargo Software. I bring 21 years of experience building backend services and distributed systems, with deep experience in Python, including FastAPI and Tornado, Go, PostgreSQL, APIs and high-throughput platforms. My earlier work in fleet telematics also gives me direct experience with transport-related systems: at Nordfels Telematik, I developed backend services ingesting GPS data from 300,000 vehicles.

At Streamhaus, I led the technical development of the playback API and designed a Go entitlement service handling up to 120,000 requests per second. I later led the platform organisation through a migration from a Python 2 monolith to approximately 60 Python and Go services, improving playback API availability from 99.5% to 99.95%. Although I have led engineering organisations, I continue to write code every week and remain motivated by designing, implementing, and improving backend services. These projects involved building reliable services at scale and making practical architecture decisions—experience I would bring to Tessel's event ingestion and tracking APIs.

Tessel's focus on reliable shipment visibility, clear design notes and engineers taking ownership of services aligns well with the way I have worked. I have used PostgreSQL/PostGIS, RabbitMQ and Kafka, and my experience deploying services on GKE and working with Kubernetes, Terraform, Prometheus, Grafana and OpenTelemetry would support Tessel's focus on cloud operations and observability. I also introduced architecture reviews and on-call guidelines adopted company-wide, and built a Python test harness that was used by QA for eight years.

I would welcome the opportunity to discuss how my backend and transport-systems experience could contribute to Tessel's Routing & Tracking team. Thank you for your consideration.

Kind regards,
Rafael Moretti-Klein
