Dear Corvale Mobility hiring team,

I'm applying for the Cloud Infrastructure / DevOps Contractor role. I bring 10 years of infrastructure experience, including six years operating Kubernetes platforms on AWS, and a track record of turning infrastructure needs into reliable platforms that product teams can use effectively.

At Tallybrook, I'm the technical lead of a five-person platform team operating eight EKS clusters across three regions. At Brightwater Games, I managed Terraform across approximately 40 AWS modules, using Atlantis to run plan and apply through pull requests. I designed and built an internal developer platform adopted by all 14 product teams, reducing the time for a new service to reach production from around two weeks to under one day. I've also led technical work across teams, including a Karpenter migration that reduced EC2 spend by 38%, and introduced SLOs and an incident process that helped reduce on-call pages by approximately 60%. As technical lead, I have led platform decisions across product and platform teams, including agreeing an error-budget policy with product leadership and introducing service templates and self-service infrastructure that all 14 product teams adopted.

Corvale's work to connect a new train fleet with cloud services calls for careful infrastructure design, operational reliability and collaboration across engineering teams. My background in hands-on AWS infrastructure engineering and cloud environment design and operation, Terraform, Kubernetes platforms, observability and technical leadership is directly relevant to building and operating that foundation. I'd welcome the opportunity to discuss how I could contribute to the fleet connectivity platform.

Best wishes,

Nadia Brennan-Aziz
