Dear Halden Pay Hiring Team,

I am applying for the Senior Data Engineer – Data Platform position. In my current role as a Test & Validation Engineer at Corvane Automotive Components, I have built Python-based tools that turn test-rig output into checked, reportable data for engineering teams.

My main workflow processes approximately 2 GB of TDMS and CSV data each week across six rigs. It checks channels against test specifications, generates report figures and runs nightly on a lab PC; summary results are written to an IT-created staging table in SQL Server. I packaged the tool for internal use, and four other test engineers now use it for their tests. I also created a Power BI dashboard using the staging data, giving around 15 validation and design engineers visibility into pass/fail trends and cycles to failure. These projects have given me practical experience building useful data workflows, improving data checks and reporting, and supporting colleagues who rely on the results. This involved defining practical validation checks, operating a repeatable scheduled workflow, and packaging a reusable internal tool for multiple engineering users.

I am developing this experience further through an online data engineering course, of which I have completed six of nine modules. Alongside the course, I have built a small Flask API using SQLite and explored Docker Compose and Git in a personal project. Halden Pay's focus on a shared data platform and reusable frameworks interests me because I have turned a recurring test-data process into a reusable internal tool used by multiple engineers. I would welcome the opportunity to bring my hands-on experience with Python data processing, test-data quality checks, scheduled workflows and SQL Server reporting to the Data Platform team, while continuing to grow in data engineering.

As a Portuguese citizen, I am able to commute to Lisbon for hybrid work. Thank you for your time and consideration. I would welcome the opportunity to discuss my application.

Best regards,

Tiago Ferrão-Lindqvist
