Dear Hiring Team,

I am applying for the Backend Engineer (Python) role on Tessel Cargo Software's Routing & Tracking team. My background combines hands-on Python and Go backend engineering with experience building reliable, high-volume APIs and ingesting operational data—work that maps closely to your event ingestion and live tracking platform.

At Streamhaus, I was technical lead for the playback API and designed a Go and Cassandra entitlement service that handled 120k requests per second at peak. Later, as Director of Engineering, Platform, I led the migration from a Python 2 monolith to around 60 Python and Go services on GKE, improving playback API availability from 99.5% to 99.95%. I continue to code weekly, primarily on internal tooling in recent years, and bring experience with Python, FastAPI, PostgreSQL, Kafka, Kubernetes, Terraform and observability tools including Prometheus, Grafana and OpenTelemetry.

Earlier, at Nordfels Telematik, I built backend services ingesting GPS data from 300k vehicles and worked with PostgreSQL/PostGIS and RabbitMQ. That experience gives me a direct connection to the operational data flows behind shipment tracking. I have also introduced architecture review and on-call practices, and co-authored service and Python engineering guidance—experience relevant to dependable services, clear design notes and shared production ownership.

Tessel's focus on turning carrier events into a reliable live picture of shipments is a strong match for the systems I have built. I would welcome the opportunity to discuss how my backend and platform experience could contribute to the Routing & Tracking team.

Sincerely,
Rafael Moretti-Klein
