Dear Corvale Mobility Hiring Team,

I am applying for the Cloud Infrastructure / DevOps Contractor role supporting fleet connectivity. My experience building and operating Azure infrastructure, writing Terraform modules, and improving deployment pipelines aligns with the role's focus on taking cloud infrastructure from design through production.

In my current contract at Havenstad Logistics, I am part of a three-person cloud team operating an Azure estate of approximately 400 virtual machines and 12 AKS clusters across three subscriptions. I have written Terraform modules for hub-spoke network infrastructure, Azure Firewall, and private endpoints, and moved release pipelines for 15 internal applications from manual deployments to Azure DevOps YAML pipelines. Earlier, I led a lift-and-shift migration of 60 servers from VMware to Azure IaaS and supported Windows and Linux server environments at municipal scale.

I would bring hands-on infrastructure engineering, practical networking and security experience, and an automation-focused approach to Corvale's work connecting on-board train systems with backend services. My background includes Azure networking, firewalls, private endpoints, Active Directory, MFA, and conditional access, alongside Terraform and Linux administration. I am particularly interested in the engineering challenge described in the role: helping shape the infrastructure for a new fleet and supporting a platform that is observable, reliable, and secure.

Thank you for considering my application. I would welcome the opportunity to discuss how my cloud infrastructure and automation experience could contribute to the fleet connectivity team.

Kind regards, Samuel Achterberg-Osei
