Dear Verdane Care hiring team,

I'm applying for the Full-Stack Engineer role in the Patient Experience squad. My recent work at Älvgrind Fintech has involved onboarding features built with React and TypeScript, NestJS, PostgreSQL, and AWS—the core technologies named in your role.

I implemented an identity-verification step using Swedish BankID, including QR-code and same-device flows, and A/B-tested it on 10% of traffic before full rollout. Onboarding conversion increased from 61% to 74%. I also worked on secure ID document uploads using S3 presigned URLs, Lambda virus scanning, SQS, and PostgreSQL. These projects have given me experience building user-facing features across the frontend, APIs, and database components.

I have also worked on an incremental migration of an onboarding backend from Express to NestJS, route by route behind the same API gateway, and shared the migration in a 2022 meetup talk. Earlier, I was tech lead and primary app developer for a React Native ferry ticket app that supports offline ticket use and has approximately 50,000 downloads. Frontend development is where I am strongest, and I have also taken on team coordination, serving as acting team lead for four months in 2024 and handling 1:1s and sprint planning.

Verdane Care's focus on making booking and follow-up simpler for patients is compelling to me, particularly because I value seeing the impact of software on the people who use it. I would welcome the opportunity to bring my React and TypeScript experience, along with my Node.js and PostgreSQL work, to your Patient Experience squad.

Thank you for considering my application.

Oskar
