Dear Hiring Manager,

I am applying for the Cloud Infrastructure / DevOps Contractor role with Corvale Mobility. The opportunity to help shape cloud infrastructure for the new train fleet and take it into production aligns closely with my experience building and operating AWS platforms and infrastructure-as-code systems.

At Tallybrook, I lead a five-person platform team operating an EKS environment across three regions. I built a developer platform using service templates, Argo CD GitOps and Crossplane self-service for AWS services, helping reduce the time to take a new service to production from around two weeks to under a day. I also introduced SLOs and error budgets for critical services and contribute to incident command and post-incident processes. This work has centered on making production services reliable, observable and easier for development teams to run.

Previously, at Brightwater Games, I operated AWS backend infrastructure for titles with up to 1.2 million daily active players and managed infrastructure as code with Terraform across approximately 40 modules. I used Atlantis to run plan and apply through pull requests, and built an observability stack with Prometheus, Grafana, Alertmanager and Loki. These experiences offer a strong foundation for Corvale's cloud infrastructure, system design and service-operability needs as the vehicle-to-cloud platform develops.

I would welcome the opportunity to discuss how my AWS, Terraform, platform engineering and technical leadership experience could contribute to Corvale's fleet connectivity work. Thank you for your consideration.

Yours sincerely, Nadia Brennan-Aziz
