AI Team, Customer Operations

Application: Machine Learning Engineer – Customer Support AI

Dear Hiring Team,

Your Customer Operations AI team's work combines two areas of my experience: taking NLP models into production and classifying customer support-related text. I am applying for the Machine Learning Engineer – Customer Support AI role with more than five years of experience in NLP and document classification, including transformer fine-tuning, Azure-based model serving and production monitoring. My background offers a practical foundation for building and operating models that help route merchant questions and support agents.

At Slavonica Document AI, I developed an automatic document classifier that achieved 94% accuracy across 23 classes for public administration clients. I also fine-tuned BERTić and XLM-R for named entity recognition in Croatian documents. To support model delivery and operation, I introduced MLflow for experiment tracking and a model registry; our models are served through FastAPI services in Docker containers on Azure ML and Azure App Service. I established production quality monitoring, including data drift monitoring and weekly reporting. This experience closely matches your need to move from prototypes to deployed, monitored ML systems.

Previously, at Baranjska kreditna banka, I classified customer complaint topics using TF-IDF and logistic regression, later using fastText. That work is directly relevant to understanding and categorising support requests, while my churn modelling and SQL reporting experience adds a financial-services perspective. My research work building and annotating Croatian legal-text corpora, together with my ongoing PhD in named entity recognition, provides further grounding in text data preparation and language modelling.

Quillstone's focus on helping merchants get answers quickly gives this combination of production engineering and text classification a clear application. I would welcome the opportunity to discuss how my Python, NLP and MLOps experience could contribute to your Customer Operations AI team. Thank you for considering my application.

Yours sincerely,
Petra Zlatarić-Novosel
