Dear Verdane Care hiring team,

I am applying for the Full-Stack Engineer (TypeScript / React) role in your Patient Experience squad. At Älvgrind Fintech, I build onboarding features with React, TypeScript, NestJS and PostgreSQL—the same core stack you use for patient-facing features. Frontend development is my strongest area, backed by hands-on experience building the services and data flows behind it.

One relevant example is a BankID identity verification step supporting QR-code and same-device flows through a provider SDK. We A/B tested it on 10% of traffic before full rollout, and onboarding conversion increased from 61% to 74%. Your booking and intake journeys similarly depend on helping users complete important steps without unnecessary friction. I also built an ID-document upload flow using S3 presigned URLs, ClamAV scanning in Lambda and SQS-based status processing into PostgreSQL. That experience is relevant to the careful handling of sensitive documents, without assuming that fintech and health-data requirements are identical.

On the backend, I helped migrate onboarding routes incrementally from Express to NestJS behind the same API gateway, and presented the work at a meetup. I also covered our team lead for four months in 2024, conducting one-to-ones and sprint planning. Earlier, I was technical lead for a ferry-ticket app with approximately 50,000 downloads, building most of the React Native app in a two-developer team.

Verdane Care's emphasis on simple patient journeys, privacy by default and WCAG 2.2 AA makes the purpose of this role concrete. I would welcome the opportunity to discuss how my frontend strengths, full-stack delivery experience and work improving onboarding could contribute to your Patient Experience squad.

Kind regards,
Oskar
