Dear Halden Pay Hiring Team,

I am applying for the Senior Data Engineer - Data Platform position. As a Test & Validation Engineer at Corvane Automotive Components, I have developed Python data-processing tools that other engineers use in their daily work. Your emphasis on reusable frameworks rather than one-off pipelines connects directly with my experience turning laboratory scripts into a shared internal tool.

My scripts process approximately 2 GB of TDMS and CSV data each week from six test rigs, flag channels outside test specifications and generate report figures. They run nightly through Windows Task Scheduler and write summary results to an SQL Server staging table created by IT. Four other test engineers now use the tool for their own tests. I also built a Power BI dashboard showing pass/fail trends and cycles to failure by product generation, used by approximately 15 validation and design engineers. This work gives me practical experience connecting source data, quality checks and reporting for engineering users.

I am making a deliberate transition into data engineering and have completed six of nine modules of an online course. My experience is in laboratory data tooling rather than production cloud platforms, and I would also welcome consideration at a junior or mid-level. Alongside my work, I built a local Flask and SQLite API and followed a tutorial to run it with Docker Compose. Halden Pay's focus on shared data capabilities, together with its learning budget and mentoring programme, makes this a relevant opportunity for that transition.

I would welcome a conversation about how my Python tooling, test-data validation and reporting experience could contribute to your Data Platform team. Thank you for considering my application.

Best regards,

Tiago Ferrão-Lindqvist
