Dear Hiring Team at Halden Pay,

I am applying for the Senior Data Engineer – Data Platform position. I have nine years of experience building and operating data platforms across logistics, e-commerce and payments, with a strong background in Python, SQL, cloud warehouses and production data pipelines.

At Lukovac Freight Hub, I own the ingestion layer of the data platform, operating around 140 Airflow DAGs and building reusable data processes for teams across the company. I migrated approximately 300 stored procedures into tested and documented dbt models, reducing the nightly warehouse build from 5 hours 10 minutes to 1 hour 35 minutes. I have also introduced data contracts with CI checks and built Kafka-based streaming and CDC pipelines. These projects reflect the kind of platform ownership, data quality work and practical reduction of complexity described in your role.

Earlier, at Kovalent Pay, I built PySpark jobs on AWS EMR to reconcile bank settlement files against internal ledgers, processing around 1.2 TB of raw files daily. The work reduced manual month-end reconciliation from about three days to four hours. I also designed a Redshift warehouse used by finance and risk and wrote a Python library for S3 and Glue access that was adopted by four teams. My production cloud experience is with AWS, alongside hands-on work with Airflow, dbt, Docker, CI/CD and open-source contributions, including two merged fixes to an Airflow provider.

Halden Pay’s focus on a shared data platform for analytics, data science and product teams is a strong match for the work I have done. I would welcome the opportunity to discuss how my experience in platform operations, data modelling and reliable pipelines could contribute to your Data Platform team.

Kind regards,
Lena Varga-Holm
