Dear Tessel Cargo Software hiring team,

I would like to apply for the Backend Engineer (Python) position on your Routing & Tracking team. I have over seven years of backend experience, primarily in Java and Spring, and would welcome the opportunity to work mainly in Python. My Python experience so far is limited to scripts and Jenkins helpers rather than production services, but my production background in APIs, event-driven services, testing, and cloud deployment provides a strong comparable-language foundation.

At Tejo Insurance Tech, I designed a versioned REST API used by 12 broker partners and reduced its quote endpoint's p99 latency from 1.8 seconds to 450 ms by adding Redis caching and fixing N+1 database queries. The API used PostgreSQL, and I improved query performance by fixing N+1 JPA queries. I also implemented a transactional outbox and idempotent Kafka consumers, reducing duplicate claims from around 40 per week to zero over the following quarter. That work on dependable APIs and event processing would be relevant to Tessel's shipment tracking platform.

I enjoy the moment when a fragile part of a system becomes predictable. At Viajar Online, I raised payments-module test coverage from 35% to 70% using Testcontainers, supporting safer refactoring. In my current role, I deploy Dockerized services to Kubernetes on AWS EKS through Jenkins CI/CD pipelines and participate in the on-call rota one week per month. I also handled and documented a Kafka-lag production incident, reinforcing my approach to clear incident communication and reliable service ownership. Tessel's emphasis on service ownership, clear documentation and reliability is a strong match for the work I enjoy.

I work in English across my current team and am fluent in written and spoken English. Thank you for considering my application. I would welcome the chance to discuss how my backend and production experience could contribute to your team.

Best regards,
Daniel Okafor-Reyes
