Application: Backend Engineer (Python) – Shipment Tracking Platform

Dear Hiring Team,

I am applying for the Backend Engineer (Python) role on Tessel Cargo Software's Routing & Tracking team. My Kafka incident-response, production on-call support, and incident-documentation experience aligns with the Routing & Tracking team's focus on reliable shipment-event services.

At Tejo, I take part in a monthly on-call rotation and handled a major Kafka lag incident in March 2024; the incident write-up was praised. I also run our backend guild meeting every two weeks, a responsibility I have held since 2024. These experiences have strengthened my incident-investigation, technical documentation, and knowledge-sharing practice, which I would bring to your team's on-call work and post-incident discussions.

I hold the Oracle Certified Professional Java SE 11 Developer certification and bring production-support experience and operational exposure to AWS services including EKS, S3, and SQS. I also have user-level operational exposure to EKS, S3, and SQS and can read existing Terraform configuration, although I have not developed Terraform modules. I am seeking to move toward Python-based backend work; my Python experience to date is limited to data-fix scripts and small Jenkins helpers rather than production services. I am also developing Go through a personal OpenAPI specification-diff CLI project.

I have worked entirely in English at Tejo and would welcome the opportunity to discuss how my Kafka event-streaming, production incident investigation, post-incident documentation, on-call support, and backend knowledge-sharing experience could contribute to the Routing & Tracking team. Thank you for your consideration.

Kind regards,
