Dear Tessel Cargo Software team,

I am applying for the Backend Engineer (Python) role to bring my experience building reliable backend services and distributed systems to your shipment tracking platform. After leading platform engineering at Streamhaus, I am looking to return to a hands-on individual contributor role, working close to the code and the services I help build.

At Streamhaus, I designed and wrote most of a Go entitlement service that handled 120,000 requests per second at peak, and served as technical lead for the playback API. I also helped migrate a Python monolith into approximately 60 Python and Go services, improving playback API availability from 99.5% to 99.95%. This work involved service design, production reliability, and clear technical decisions across a large distributed platform. Earlier, I built backend services that ingested GPS data from 300,000 vehicles for a fleet-telematics platform, an experience directly relevant to tracking and transport systems.

I would bring substantial Python backend experience with FastAPI and Tornado, PostgreSQL/PostGIS and message-oriented systems, Kafka, and production observability with Prometheus, Grafana, and OpenTelemetry. I have also worked with Kubernetes and Terraform when deploying and operating services on GKE. I also bring practical automated-testing experience, including a Python test harness used by QA for eight years. At Streamhaus, I introduced an RFC process, architecture reviews, and on-call guidelines adopted company-wide. Tessel's emphasis on practical ownership, concise design notes, and a sustainable approach to reliability particularly appeals to me.

I would welcome the opportunity to discuss how my experience could contribute to the Routing & Tracking team. Thank you for your consideration.

With best regards,
Rafael Moretti-Klein
