Dear Hiring Team,

I'm applying for the Backend Engineer (Python) role on Tessel Cargo Software's Routing & Tracking team. I'm looking to return to hands-on backend engineering as an individual contributor, and my recent development work has included Python internal tools and cost-dashboard scripts. I have recently refreshed my Python skills and am prepared to work mainly in Python.

My background also includes Go and GCP, which is my primary cloud platform, as well as limited historical AWS exposure with EC2 and S3. I would bring my experience developing internal tools and cost-dashboard scripts, together with my GCP background and limited historical AWS exposure, to a team working on shipment-event ingestion and tracking services, while building further depth in the technologies central to this role.

Tessel's emphasis on dependable services, clear documentation, pragmatic engineering and a sustainable pace particularly appeals to me. The team's focus on reliability work and concise design notes reflects the pragmatic, sustainable engineering approach I value. I would welcome the opportunity to discuss how my experience and hands-on focus could contribute to the Routing & Tracking team.

Thank you for your consideration.

Sincerely,
Rafael
