Dear Corvale Mobility Hiring Team,

I am applying for the Cloud Infrastructure / DevOps Contractor – Fleet Connectivity role. I bring hands-on experience designing and operating Azure infrastructure, building it with Terraform, and improving how teams deploy and run services. Corvale's plan to connect a new generation of trains with its cloud platform particularly interests me because it calls for thoughtful infrastructure design, reliable operations and close collaboration across engineering teams.

In my current Cloud Engineer contract, I work in a three-person team operating an Azure estate of approximately 400 virtual machines and 12 AKS clusters. I developed Terraform modules for hub-spoke networking across three subscriptions, including Azure Firewall and private endpoints, and added Terratest module checks and nightly drift detection. I also replaced manual releases for 15 internal applications with Azure DevOps pipelines, helping increase deployment frequency for most applications from roughly monthly to several times per week.

Earlier, as a Systems Administrator, I led the planning and execution of a lift-and-shift migration of 60 VMware servers to Azure IaaS. The cutovers took place over six weekends without unplanned downtime. Across these roles, I have worked with cloud networking, Windows and Linux systems, security controls and infrastructure automation. I hold both the Microsoft Azure Administrator Associate and HashiCorp Terraform Associate certifications.

I would welcome the opportunity to discuss how my Azure infrastructure, Terraform and operational experience could contribute to Corvale's fleet connectivity platform and its end-to-end engineering approach.

Kind regards,
Samuel Achterberg-Osei
