Dear Halden Pay Hiring Team,

I am writing to apply for the Senior Data Engineer – Data Platform role. Across 12 years in mechanical engineering, I have used Python and SQL to turn test data into reliable analysis and practical engineering decisions. I am now interested in moving into data engineering, and the opportunity to help build reusable data-platform capabilities at Halden Pay particularly appeals to me.

In my current role at Corvane Automotive Components, I developed Python tools with pandas, NumPy and Matplotlib to process test-rig files, validate channels against specifications and generate standard report figures. This reduced report preparation from about three days to half a day per test. I also query a SQL Server test-results database to analyse trends across three product generations. These experiences have given me a practical foundation in data processing, validation and analysis, as well as a strong appreciation for consistent, dependable data outputs.

My background also includes working across engineering activities to solve problems and improve processes: I correlate test results with FEA, lead 8D root-cause analysis, and have supported the conversion of a test bench to a PLC-controlled setup. I would bring this ownership-oriented approach to working with Halden Pay's data, analytics and product colleagues. I am keen to build on my existing Python and SQL experience while developing further in data architecture and platform engineering.

Halden Pay's focus on shared platform capabilities and its values of Together, Ownership and Pace resonate with how I approach engineering work: collaborating across teams, taking responsibility for results, and simplifying processes where possible. I would welcome the opportunity to discuss how my experience in test-data automation and analysis could contribute to the Data Platform team.

Yours sincerely,

Tiago Ferrão-Lindqvist
