Dear Halden Pay Data Platform Hiring Team,

I am applying for the Senior Data Engineer – Data Platform position. In my current role as a Test & Validation Engineer at Corvane Automotive Components, I have built internal tools that turn recurring engineering test data into usable reports and insights—experience I am keen to build on as I develop toward shared data-platform engineering.

Since 2021, I have developed Python scripts that process TDMS and CSV output from six test rigs—about 2 GB per week—flag channels outside test specifications, and generate report figures. The scripts run nightly and write summary results to an IT-created staging table in SQL Server. Four other test engineers now use the tool for their tests. I also built a Power BI dashboard using the staging data to show pass/fail trends and cycles to failure by product generation; it is used by around 15 engineers in validation and design.

Alongside my work experience, I have built a small Flask API over SQLite and followed a Docker Compose workflow in a personal learning project, using Git for the project repository.

The role's focus on reusable capabilities and practical data-quality checks connects with my experience building an internal tool that flags channels outside test specifications, runs nightly, and is used by colleagues across validation and design. My engineering background also includes durability and vibration testing, root-cause analysis, and a MATLAB/Simulink model used to select rig load profiles. I am currently completing an online data engineering course, with six of nine modules finished, as I develop my skills in this direction.

I would welcome the opportunity to discuss how my experience building and supporting internal data tools could contribute to Halden Pay's Data Platform team through practical Python data processing, reusable internal tooling, data-quality checks, and support for validation and design users. Thank you for your time and consideration.

Best regards,
Tiago Ferrão-Lindqvist
