Dear Hiring Team,

I'm applying for the Cloud Infrastructure / DevOps Contractor – Fleet Connectivity role. I'm a senior platform and reliability engineer with 10 years of infrastructure experience, including six years operating Kubernetes platforms on AWS.

At Tallybrook, I lead technical work as tech lead of a five-person platform team, agreeing reliability practices with product leadership. I built Go and Python service templates, Argo CD and Crossplane self-service into an internal developer platform adopted by all 14 product teams, cutting time to production from about two weeks to under one day. SLOs and burn-rate alerts for critical services reduced on-call pages by about 60%; I also agreed the error-budget policy with product leadership.

Earlier, at Brightwater Games, I operated AWS game-backend infrastructure for titles with up to 1.2 million daily players, managing about 40 Terraform modules with Atlantis. A k6 test simulating 300,000 concurrent players exposed a connection-pool limit we fixed before release. I'd bring hands-on infrastructure engineering, AWS environment design and operation, systems and platform design experience, VPC and IAM knowledge, Linux administration, and a practical reliability mindset. My platform work reflects how I support product teams with self-service paths, sensible defaults and observable services. I welcome a discussion about taking infrastructure from design through reliable operation.

Best wishes,

Nadia Brennan-Aziz
