Dear Corvale Mobility Hiring Team,

I am applying for the Cloud Infrastructure / DevOps Contractor role. In my current test-infrastructure role, I own GitLab CI pipelines and build short-lived Kubernetes test environments for three product teams. That work has given me practical experience automating deployments, improving repeatability and helping developers test changes in environments close to their service workflows.

I have reduced average pipeline time from 38 to 14 minutes, and built merge-request environments using Helm on a shared Kubernetes cluster, with PostgreSQL, seeded data and automatic cleanup. I also wrote the internal guide to our CI workflows used in onboarding. These projects have required me to make infrastructure easier for teams to use and to work across QA, product and development needs—experience I would bring to supporting backend developers and keeping a platform approachable and observable.

I am building further infrastructure experience through a personal three-node k3s cluster managed with Argo CD, with Prometheus, Grafana and Loki monitoring. I have also provisioned a small Hetzner VPS with Terraform. My professional Kubernetes work is at namespace level, and my AWS experience is currently personal learning covering EC2 and S3 basics. I am studying for the CKA exam, scheduled for January 2027.

Corvale's work to connect a new train fleet with its cloud platform makes this a distinctive infrastructure challenge. I would welcome the opportunity to discuss how my CI/CD and test-environment experience could contribute to the team, while I continue developing toward cloud and platform engineering.

Kind regards,
Marta Kowal-Brandt
