Dear Corvale Mobility Hiring Team,

I am applying for the Cloud Infrastructure / DevOps Contractor – Fleet Connectivity role. Over seven years in QA and test infrastructure, I have increasingly focused on the systems that help product teams build, test and deliver reliable software. I am interested in bringing that experience to a team shaping infrastructure for connected train systems.

At Odrava Health Software, I own GitLab CI pipelines for three product teams and build short-lived merge-request environments with Docker Compose and Helm, deployed to a shared Kubernetes cluster with namespace-level access. By parallelising test jobs, caching dependencies and separating end-to-end tests into their own stage, I reduced average pipeline duration from 38 to 14 minutes and monthly CI runner costs by about 30%. I also maintain a pytest and Playwright suite of approximately 900 tests, with the flaky-test rate reduced from 7% to under 1%. These projects have given me practical experience improving delivery workflows, test environments and observability alongside developers and product teams.

I have also developed my infrastructure skills through personal projects: a three-node k3s cluster with applications deployed using Argo CD, and Terraform used to provision infrastructure for a small Hetzner VPS. The project also includes Prometheus, Grafana and Loki monitoring, Traefik ingress, and cert-manager for TLS. At work, I write Helm charts for test environments and have namespace-level access to the shared Kubernetes cluster. My Terraform experience is from personal projects, and I am continuing to build my cloud infrastructure knowledge. My cloud exposure also includes self-directed AWS fundamentals with EC2 and S3, alongside Linux-based infrastructure work. I authored the internal CI-system guide used in team onboarding and mentored two QA interns, demonstrating my ability to explain technical topics clearly and help others adopt shared engineering practices.

Corvale's need for reliable, observable infrastructure connecting distributed systems to backend services is particularly compelling to me, because my recent work has focused on making build, test and deployment environments repeatable and easier for teams to operate. I would welcome the opportunity to discuss how my CI/CD ownership, Kubernetes test-environment work, observability projects and infrastructure learning could contribute to the team while I continue developing toward broader cloud infrastructure responsibilities.

Thank you for your consideration.

Marta Kowal-Brandt
