Dear Hiring Team,

I am applying for the Backend Engineer role on Tessel Cargo Software's Routing & Tracking team. I bring seven years of professional backend experience, primarily building and operating Java services for insurance and travel products. My work has focused on reliable APIs, event-driven integrations, database performance, testing, and production operations—areas closely aligned with the needs of your shipment tracking platform.

At Tejo Insurance Tech, I develop and maintain seven Java 17/Spring Boot microservices and designed the versioned REST API used by 12 broker partners. I also work with Kafka in the claims workflow, where introducing idempotent consumers and an outbox table eliminated duplicate claim records. By adding Redis caching and resolving JPA N+1 queries, I reduced quote-endpoint p99 latency from 1.8 seconds to 450 milliseconds. These experiences have given me a practical foundation in API design, event processing, and improving the performance and reliability of production services.

I have also built integration tests with Testcontainers, increased payments-module test coverage from 35% to 70%. My database experience includes PostgreSQL, Oracle, Redis, and JPA query optimization. I deployed services to Kubernetes on AWS EKS through Helm and Jenkins pipelines. Participating in an on-call rota has made production reliability part of my day-to-day engineering work. I am particularly interested in Tessel's focus on dependable shipment visibility and its hands-on culture of service ownership, concise documentation, and sustained reliability work.

I would welcome the opportunity to discuss how my backend experience could contribute to the Routing & Tracking team. Thank you for your consideration.

Kind regards,

Daniel Okafor-Reyes
