Dear Corvale Mobility Hiring Team,

I am applying for the Cloud Infrastructure / DevOps Contractor – Fleet Connectivity role. I am a QA automation engineer with seven years of experience, including ownership of CI/CD pipelines and test infrastructure for three product teams. I am now looking to move into DevOps or platform engineering full time, and the opportunity to help shape infrastructure from the start and take it toward production is closely aligned with that direction.

At Odrava Health Software, I own GitLab CI pipelines serving approximately 25 developers. By profiling workflows, parallelising test jobs, caching dependencies and separating end-to-end testing, I reduced average pipeline runtime from 38 to 14 minutes and monthly CI runner costs by approximately 30%. I also built short-lived merge-request environments using Docker Compose and later Helm on a shared Kubernetes cluster, with automatic cleanup. I also documented how the CI system works for onboarding and mentored two QA interns, helping make the tooling easier for colleagues to understand and use.

My infrastructure experience also includes a personal three-node k3s homelab, where I use Argo CD for GitOps and run Prometheus, Grafana and Loki for monitoring. I configured Traefik ingress and cert-manager for TLS, and provisioned a small Hetzner VPS with Terraform. This work has involved Linux-based environments, GitOps workflows, monitoring, ingress, and TLS certificate management. My Terraform work is currently personal-project experience, and my AWS exposure is basic free-tier learning with EC2 and S3. At Odrava, I deploy Helm-based test environments to a shared Kubernetes cluster with namespace-level access, focusing on repeatable delivery, monitoring, and automatic lifecycle management.

Corvale's engineering-led environment appeals to me because it values ownership, practical problem solving, and collaboration across teams—qualities I have applied while owning CI pipelines, building shared test infrastructure, and helping colleagues use it effectively. My approach is analytical and measurable: I profile bottlenecks, test changes, and use operational data such as pipeline duration, runner cost, and flaky-test rates to guide improvements. I would welcome the opportunity to discuss how my experience improving CI systems, building test infrastructure and developing my hands-on infrastructure skills could contribute to the Fleet Connectivity team.

Thank you for your time and consideration.

Marta Kowal-Brandt
