Dear Hiring Manager,

I am applying for the Backend Engineer (Python) role at Tessel Cargo Software. My production backend work has been in Java and Kotlin, languages your job description recognizes as comparable experience, and I am keen to move into a Python-focused backend role. I have used Python for data-fix scripts and small Jenkins helpers; I have not yet shipped a Python service.

At Tejo Insurance Tech, I designed a versioned REST API for broker quote requests that now serves 12 partners and approximately 400,000 requests per month. I also addressed duplicate records caused by at-least-once Kafka delivery, implementing a transactional outbox and idempotency keys that brought duplicate claims from approximately 40 per week to zero over the following quarter. These projects have strengthened my focus on reliable APIs, data correctness, and event-driven services.

I was drawn to the role's combination of event ingestion, Kafka streams, PostgreSQL, and responsibility for services in production. I take part in a one-week-per-month on-call rota and handled a major Kafka lag incident in March 2024, followed by a post-incident report that was praised. I would bring that operational experience, along with hands-on work in Spring Boot, automated testing, Kubernetes, and AWS services, to the Routing & Tracking team.

Thank you for considering my application. I would welcome the opportunity to discuss how my backend experience could contribute to Tessel Cargo Software's shipment-tracking platform.

Best regards,
Daniel Okafor-Reyes
