Dear Hiring Manager,

I am applying for the Cloud Infrastructure / DevOps Contractor role supporting Corvale Mobility's fleet connectivity platform. My recent work combines Azure infrastructure engineering, Terraform, and deployment automation—experience I can bring to building and operating the cloud foundations for services connecting the new train fleet with backend systems.

At Havenstad Logistics, I designed a Terraform-based Azure hub-spoke network across three subscriptions, including Azure Firewall, private DNS, private endpoints, and VNet peering. I added Terratest module tests and nightly drift detection. I also replaced manual deployments for 15 internal applications with Azure DevOps pipelines for build, test, and deployment to App Service or AKS, increasing deployment frequency from roughly monthly to several times per week for most applications. I operate AKS upgrades, node pools, and ingress, working alongside development teams that own the application manifests.

Earlier, I planned and executed the migration of 60 VMware servers to Azure IaaS, completing the cutover over six weekends with no unplanned downtime. My experience with cloud networking, infrastructure as code, practical Microsoft 365 security controls, and reliable deployment processes is relevant to Corvale's goal of taking fleet connectivity infrastructure from design through production. I am particularly interested in the role's combination of infrastructure design and operational responsibility for a new generation of trains.

I would welcome the opportunity to discuss how my Azure and Terraform experience could contribute to Corvale's platform. Thank you for your consideration.

Kind regards,

Samuel Achterberg-Osei
