Marta Kowal-Brandt

Dear Corvale Mobility Hiring Team,

I am applying for the Cloud Infrastructure / DevOps Contractor – Fleet Connectivity role. In my current test-infrastructure role at Odrava Health Software, I own CI pipelines for three product teams and build short-lived test environments on a shared Kubernetes cluster. This work has given me practical experience improving the reliability and operability of systems that developers depend on every day.

After analysing pipeline bottlenecks, I reduced average pipeline time from 38 to 14 minutes and monthly CI runner costs by about 30% by parallelising jobs, caching dependencies and separating end-to-end tests into their own stage. I also built merge-request environments with Helm, application services, PostgreSQL and seeded data, with automatic cleanup after merge or inactivity. Alongside this, I maintain a pytest and Playwright suite of around 900 tests and built Python and PostgreSQL tooling with Grafana dashboards to help teams identify flaky tests.

I am moving toward DevOps and platform engineering, and have extended my practical experience through a personal k3s cluster deployed with Argo CD, with Prometheus, Grafana and Loki for monitoring. The cluster also uses Traefik ingress and cert-manager for SSL/TLS certificate management. My professional infrastructure work has focused on shared Kubernetes test environments, while my Terraform and cloud exposure has been developed through personal infrastructure projects. I have also completed learning projects covering AWS EC2 and S3 basics. At Odrava, I work with Helm charts and namespace-level access on the shared Kubernetes cluster rather than owning the cluster itself. I also authored the internal CI guide used in onboarding, translating pipeline design and operating practices for QA and development teams, and mentored two QA interns in 2023.

Corvale's engineering-led approach and focus on teams owning systems end to end appeal to me. I would welcome the opportunity to discuss how my experience in CI/CD, test environments and reliability-focused tooling could contribute to the Fleet Connectivity team through CI/CD ownership, observable and reliable test infrastructure, Kubernetes-based environments, and clear technical communication.

Thank you for your time and consideration.
