Dear Corvale Mobility hiring team,

I'm applying for the Cloud Infrastructure / DevOps Contractor role. I bring ten years of infrastructure experience, including six years operating Kubernetes platforms on AWS, and a track record of taking platform initiatives from design through production.

At Tallybrook, I'm the tech lead of a five-person platform team operating an EKS platform across eight clusters and three regions. I built an internal developer platform adopted by all 14 product teams, reducing the time to take a service to production from around two weeks to under one day. I've also led technical platform changes with measurable reliability and cost outcomes, including introducing SLOs and error budgets in agreement with product leadership and moving workloads to Karpenter, reducing EC2 spend by 38%. This work involved shaping the platform approach, agreeing the error-budget policy with product leadership, and bringing all 14 product teams onto a self-service path.

Corvale's work to shape cloud infrastructure for train connectivity from the start is a compelling application of that experience. At Brightwater Games, I operated AWS cloud infrastructure managed in Terraform, maintaining approximately 40 modules with Atlantis plan/apply workflows, and contributed to load testing and launch capacity planning for services supporting up to 1.2 million daily active players. That work strengthened my approach to systems architecture and system design: I use load testing, capacity planning, and operational evidence to challenge assumptions before production. I would bring hands-on AWS, Linux, VPC, IAM and infrastructure-as-code experience, along with a focus on observability, reliability and clear technical decisions, to the design and operation of Corvale's platform. I would bring that platform and systems experience to a new, reliability-focused connectivity environment. I have also supported backend developers with service templates, GitOps delivery, and self-service AWS resources designed to make services easier to deploy, monitor and run.

I'd welcome the opportunity to discuss how my experience in AWS platform operation, infrastructure as code, observability and production reliability could contribute to Corvale's fleet connectivity team.

Best wishes,
Nadia Brennan-Aziz
