Dear Halden Pay Data Platform Hiring Team,

I am applying for the Senior Data Engineer – Data Platform position. My background combines 12 years in mechanical engineering with hands-on development of Python tools that turn test data into reliable reports and engineering decisions. I am now moving toward data engineering, and the team's focus on reusable platform capabilities is closely aligned with that direction.

At Corvane Automotive Components, I developed a Python workflow that parses approximately 2 GB of TDMS and CSV data per week from six test rigs, checks channels against test specifications and generates report figures. It runs nightly on a lab PC, writes summary results to a staging table in SQL Server, and is used by four other test engineers. I also built a Power BI dashboard from that table for around 15 validation and design engineers. These projects reduced report preparation from approximately three days to half a day per test and made test-result trends easier for colleagues to use.

My experience is with practical internal data-processing workflows rather than a cloud data platform: the scripts run on a lab PC, and IT created the SQL Server staging table. I am currently completing an online data engineering course, with six of nine modules completed. I would bring a strong foundation in Python-based data processing, SQL querying, test-data quality checks and collaboration with engineering and BI users, while continuing to develop my data engineering experience. I am happy to commute to Lisbon for the hybrid arrangement.

I would welcome the opportunity to discuss how my experience and transition into data engineering could contribute to Halden Pay's Data Platform team. Thank you for your consideration.

Best regards, Tiago Ferrão-Lindqvist
