Dear Hiring Team at Halden Pay,

I am applying for the Senior Data Engineer – Data Platform position. I have nine years of experience building data platforms across logistics, payments and retail, and I am drawn to the role's focus on a shared platform that teams can rely on rather than one-off pipelines.

At Lukovac Freight Hub, I own ingestion and orchestration for our data platform, including approximately 140 Airflow DAGs loading into Snowflake, and participate in the on-call rotation. I migrated around 300 stored procedures to dbt, introducing incremental models and CI checks that helped reduce the nightly warehouse build from 5 hours 10 minutes to 1 hour 35 minutes. I also introduced data contracts and CI checks between product and data teams, reducing broken-pipeline incidents from roughly nine to two per month.

Previously at Kovalent Pay, I built PySpark reconciliation jobs on AWS and designed a dimensional Redshift warehouse used by finance and risk. The reconciliation work reduced manual effort from about three days to four hours per month-end. I have also built an internal Python library used by four teams and contributed fixes and tests to a community Airflow provider. That combination of payments experience, cloud platform work and reusable tooling fits well with the work described at Halden Pay.

I enjoy making pipelines easier to understand and trust, and sharing what I learn: I mentor two engineers and run weekly data platform office hours. I would be glad to discuss how I could help your team build and operate its shared data platform.

Kind regards,
Lena Varga-Holm
