Dear Tessel Cargo Software hiring team,

I am applying for the Backend Engineer (Python) role on the Routing & Tracking team. I bring more than six years of backend experience in Java and Kotlin, building and operating services that depend on reliable APIs, data handling and messaging. I am keen to apply that experience in a role focused mainly on Python; my Python experience so far has been limited to scripts and small Jenkins helpers.

At Tejo Insurance Tech, I designed a versioned OpenAPI 3 REST API for insurance brokers, now supporting 12 partners and around 400,000 quote requests per month. I also resolved duplicate claim records caused by at-least-once Kafka delivery by implementing a transactional outbox and idempotency keys, bringing duplicates from around 40 per week to zero over the following quarter. These projects have given me practical experience building dependable, event-driven services with PostgreSQL and Kafka.

I also bring experience with automated testing, Docker, Kubernetes and AWS, along with regular on-call work. During a major Kafka lag incident in March 2024, I helped investigate and address the issue; the incident write-up was praised. Tessel's emphasis on dependable services, clear technical communication and taking ownership of production systems strongly appeals to me, particularly in a platform that turns carrier events into live shipment visibility.

Thank you for considering my application. I would welcome the opportunity to discuss how my backend experience could contribute to the Routing & Tracking team.

Best regards,

Daniel Okafor-Reyes
