Dear Hiring Manager,

I am applying for the Machine Learning Engineer – Customer Support AI role at Quillstone Payments. I have more than five years of experience developing NLP and machine learning solutions, including taking models from research and prototyping through production deployment. I hold an MSc in Computer Science from Drava University and am currently pursuing doctoral studies in Computer Science. I am particularly drawn to the opportunity to build and operate AI systems that help merchants get support quickly and help support teams handle questions and tickets effectively.

In my current role at Slavonica Document AI, I developed a document-classification model for public-sector clients that achieved 94% accuracy across 23 classes, and fine-tuned BERTić and XLM-R models for named entity recognition in Croatian documents. I introduced MLflow for experiment tracking and model registry management, deployed models as FastAPI services in Docker on Azure ML and Azure App Service, and established weekly production monitoring for data drift. This work has given me practical experience with model serving, monitoring, cloud deployment and MLOps in production.

My earlier work includes building customer-churn prediction models with gradient boosting and LightGBM, classifying topics in customer complaints using TF-IDF features, logistic regression and fastText, and creating SQL reports from an Oracle data warehouse. Together with my doctoral research in named entity recognition for Croatian legal texts, this experience has developed my ability to work with text data and build machine learning solutions for practical needs. I would bring my Python, NLP, model-serving, monitoring and MLOps experience to Quillstone's work on routing support questions and helping support teams handle merchant inquiries.

Thank you for considering my application. I would be pleased to discuss how my experience could contribute to Quillstone's customer-support AI systems.

Sincerely,

Petra Zlatarić-Novosel
