Dear Corvale Mobility hiring team,

I'm applying for the Cloud Infrastructure / DevOps Contractor – Fleet Connectivity role. I'm a senior platform and site reliability engineer with 10 years of infrastructure experience, including six years operating Kubernetes platforms on AWS. I'm drawn to the opportunity to help shape cloud infrastructure for Corvale's new train fleet, help shape the system architecture, build the cloud infrastructure, and take it through reliable production operation.

At Tallybrook, I'm the technical lead for a five-person platform team operating an AWS EKS platform across eight clusters, around 350 services and three regions. I built an internal developer platform using Terraform, Argo CD and Crossplane, adopted by all 14 product teams, which reduced the time to take a new service to production from about two weeks to under one day. I designed the service-template and self-service approach around clear interfaces and safe defaults, allowing product teams to provision RDS, SQS and S3 through pull requests. I also introduced SLOs and error budgets for critical services, agreeing the policy with product leadership and reducing weekly on-call pages by about 60%. This demonstrates my experience designing and operating cloud infrastructure, shaping system-design decisions, and bringing product stakeholders along through clear interfaces, safe defaults, SLOs and error-budget decisions.

Earlier, at Brightwater Games, I managed AWS infrastructure with Terraform and Atlantis and supported game backends serving up to 1.2 million daily active players; earlier still, I managed approximately 600 Linux servers at Pennine Hosting. I used k6 load tests and launch capacity planning to identify and resolve a connection-pool limit before a major launch. I also mentor engineers moving into SRE.

I would welcome the opportunity to discuss how my AWS, Terraform and platform engineering experience in cloud infrastructure design and operation could contribute to Corvale's work designing and operating observable, reliable cloud infrastructure for distributed fleet-connected services.

Best wishes,

Nadia Brennan-Aziz
