Dear Corvale Mobility Hiring Team,

I am applying for the Cloud Infrastructure / DevOps Contractor – Fleet Connectivity role. My experience is in QA automation and test infrastructure, and I am moving toward DevOps and platform engineering. I'm interested in the opportunity to contribute to the infrastructure platform supporting Corvale's new train fleet, particularly the focus on reliable, observable systems that connect vehicles with cloud services.

At Odrava Health Software, I own GitLab CI pipelines supporting three product teams and have reduced average pipeline time from 38 to 14 minutes through profiling, parallelization, dependency caching and changes to the end-to-end test stage. I also built short-lived merge-request test environments using Docker Compose and later Helm on the company's shared Kubernetes cluster. These environments include applications, PostgreSQL and seeded data, run end-to-end tests, and are automatically removed after merge or inactivity. I also built test-result collection and Grafana dashboards using Python, PostgreSQL and the GitLab API, helping teams identify flaky-test patterns and reduce the flaky-test rate from 7% to below 1%. This work has given me practical experience automating infrastructure workflows and supporting teams that need dependable, repeatable environments.

My professional infrastructure experience is strongest in CI/CD and test environments. I have also built a personal three-node k3s homelab with GitOps using Argo CD, and configured Prometheus, Grafana and Loki for monitoring and logging; I also used Terraform to provision infrastructure for a small Hetzner VPS. The homelab also uses Traefik ingress and cert-manager for TLS certificate management. My AWS experience is currently limited to personal learning with EC2 and S3 basics; I have not used AWS in a work setting. I have written an internal guide to our CI workflows for onboarding and mentored two QA interns, and I value making technical processes clear and usable by others.

Corvale's engineering-led approach and its emphasis on teams owning reliable, observable systems appeal to me. In my current role, I have owned CI workflows for three teams, documented them for onboarding, and mentored two QA interns. I would welcome the opportunity to discuss how my experience in CI/CD, infrastructure as code, Kubernetes-based test environments and platform tooling could contribute to the team.

Thank you for your consideration.

Marta Kowal-Brandt
