Dear Corvale Mobility hiring team,

I am applying for the Cloud Infrastructure / DevOps Contractor role. My experience combines CI/CD ownership for three product teams with hands-on Kubernetes-based test environments, and I am now looking to move into DevOps and platform engineering. The chance to contribute to infrastructure for Corvale's new train fleet particularly interests me because it brings software delivery and real-world connectivity together.

At Odrava Health Software, I own GitLab CI pipelines used by around 25 developers. By parallelising jobs, caching dependencies and restructuring end-to-end testing, I reduced average pipeline time from 38 to 14 minutes and monthly runner costs by about 30%. I also built short-lived merge-request environments using Helm on a shared Kubernetes cluster, with PostgreSQL and seeded data, so QA and product teams can review changes and run end-to-end tests before merge. I document the CI system for onboarding and have mentored two QA interns.

I have also built a personal three-node k3s homelab with GitOps deployments, Prometheus, Grafana, Loki, ingress and TLS certificate management. I used Terraform to provision infrastructure for a small Hetzner VPS. To be precise about the scope of my experience, my production Kubernetes work is at namespace level, while my Terraform and AWS exposure is personal rather than production cloud ownership; I have not used Terragrunt. I am preparing for the CKA exam, scheduled for January 2027.

I would bring a practical automation mindset, experience improving developer workflows, and a habit of making technical systems easier to understand and use. I would welcome the opportunity to discuss how this background could contribute to Corvale's fleet-connectivity infrastructure.

Kind regards,
Marta Kowal-Brandt
